

OPTIO · INTERNAL PLANNING DOCUMENT

Credit Partner Program — design and build plan

Status: Proposal | **Drafted:** August 31, 2026 | **Owner:** Tanner

How an outside organization (a soccer club, a piano studio, a dance company, a robotics team) enrolls its participants in Optio Academy and has their participation turn into high school credit on an accredited transcript that Optio delivers to the family's school of record.

This generalizes the AGO Pipe Organ Encounter pilot (`POE_LAUNCH_PLAN.md`) from one hardcoded program into a repeatable one. Nothing here is subject-specific.

1. What the POE pilot already proved

The end-to-end path works in production today. Verified against prod on 2026-08-31:

- 28 interest signups, 20 linked participants, 14 class quests marked `credit_awarded` .
- 13 official transcripts emailed to real registrars (Agoura High School, Sage Oak Charter, Mt. Everest Academy, Green Canyon High School, BYU Online High School, Stuyvesant, Evergreen Lutheran) through `POST /api/admin/transcript/<user_id>/send` , each logged in `transcript_transfer_log` with a public verification link.

So the hard parts — accredited credit, a real transcript, delivery to a registrar who accepts it — are done. What does not scale is everything around them.

2. What does not scale

Every piece of POE is spelled with the letters P, O, E:

Hardcoded today	Where
<code>poe_cohorts</code> , <code>poe_signups</code> , <code>poe_participants</code> tables	<code>20260601_create_poe_cohorts.sql</code>
The class title, big idea, subject, pillar, logo, hero image, credit XP	<code>backend/routes/admin/poe.py</code>
The five day-by-day tasks	<code>POE_DAILY_TASKS</code> , same file
The public interest page	<code>frontend/src/programs/poe/PoePage.jsx</code>
Linking a registered user to the program	<code>POST /api/admin/poe/link-participant</code> , superadmin, one at a time
Awarding the credit	<code>POST /api/admin/poe/award-credit</code>
The school-of-record columns	<code>poe_signups</code> / <code>poe_participants</code> only
A carve-out in the transcript builder	<code>poe_quest_ids</code> in <code>transcript_generator.py</code>

Adding a second partner by copying this is a migration, a route module, a public page, and a transcript carve-out per partner. Adding the tenth is unmaintainable. The partner also has no surface of their own: every step runs through a superadmin.

3. Two things to fix before scaling

Both found while researching this plan. Both are in the direct path of partner credit.

3a. Org-managed students get no accreditation mark

`resolve_transcript_accreditation` (`backend/utils/accreditation.py`) decides whether a transcript carries the WASC mark:

- `organization_id IS NULL` → `'optio'` (treated as an Optio Academy student)
- otherwise → the org's `organizations.accreditation_source`

In prod, every organization has `accreditation_source = 'none'` — including Optio Academy itself. The five real students sitting in the Optio Academy org (`8ee22671-6e38-473c-a326-90ff86460310`) would render a transcript with no accreditation claim on it.

This has not bitten yet only because all 13 transcripts sent so far belonged to platform-direct students. It bites the day a partner's students are enrolled under an org, which is exactly what this project does.

"No `organization_id`" is a proxy for "Optio Academy student" that stops being true the moment a student belongs to any organization — and partner students frequently already belong to one (a microschool, another program). The fix is to stop inferring it. See `academy_enrollments` in §5.

3b. The POE credit has two award paths and they disagree

All 20 `poe_participants` rows have `credit_awarded_at = NULL`, yet 14 of their class quests are already `class_review_status = 'credit_awarded'`. The credit was awarded through the generic class-review path,

not `/api/admin/poe/award-credit`.

Today's transcripts are still correct, because the XP deposit that endpoint performs never happened either — so there is nothing to double-count. But the system now has two mechanisms for "this credit is awarded" that write different rows, and a carve-out in the transcript builder that keys off the one that is empty. Running the POE award endpoint on those 14 students now would deposit 1000 fine-arts XP on top of a class credit they already hold.

Pick one mechanism before there are ten partners. Recommendation in §5.4.

4. The model

Four ideas, in the shape the platform already has.

A partner is an organization. Not a new entity. `Utah Elite Sports`, `The Artful Nest Studio` and `OnFire Learning` are already `organizations` rows. Being a credit partner is a module they have switched on, per `ARCHITECTURE_BLOCKS.md`. That inherits org branding, org admin roles, invitations, and the registration funnel for free.

A student is an Optio Academy enrollee, explicitly. A row, not an inference from a null column. It is what makes the transcript an Optio Academy transcript, and it is independent of whatever org the student's account lives in. One student can hold credit from two partners and still have one Academy enrollment.

The partner attests, Optio awards. The coach confirms participation. A licensed Optio teacher reviews and awards the credit. This is the accreditation firewall, and it is also already the code's shape: awarding runs through `require_admin`, which is superadmin-only (`class_reviews.py`). The partner never gets that button.

Where the records go is captured at enrollment, once, per student. Not typed into a modal at send time by whoever happens to be sending.

5. What to build

5.1 `academy_enrollments`

The student's relationship with Optio Academy, the accredited school of issue.

```

id                uuid pk
user_id           uuid not null references users(id)
pathway           text not null  -- 'full_time' | 'parent_supported' | 'partner_credit'
status            text not null  -- 'active' | 'completed' | 'withdrawn'
grade_level       text
graduation_year   int
enrolled_at       timestampz not null default now()
withdrawn_at      timestampz
agreement_signed_at timestampz
consent_log_id     uuid references parental_consent_log(id)
unique (user_id)      -- one Academy enrollment per student

```

Then change `resolve_transcript_accreditation` to return `'optio'` when an active `academy_enrollments` row exists, **before** consulting `organization_id`. Keep the existing platform-direct fallback so nothing regresses, and separately set `accreditation_source = 'optio'` on the Optio Academy org (§3a). Backfill a row for every current platform-direct student who holds Optio credit, and for the 14 POE awardees.

5.2 student_records_destination

The registrar question, asked once, stored structured. This is the POE school-of-record columns lifted out of POE.

```

id                uuid pk
user_id           uuid not null unique references users(id)
destination_type   text not null  -- 'school' | 'homeschool' | 'optio_only'
school_name        text
school_city        text
school_state       text
school_district    text
registrar_name     text
registrar_email    text
registrar_phone    text
student_id_at_school text
auto_send_consent  boolean not null default false
consent_captured_at timestampz
updated_by         uuid references users(id)

```

`auto_send_consent` matters. Emailing a minor's transcript and date of birth to a third party is outward-facing; the family authorizes it at enrollment or it does not happen in bulk. Without consent the credit-awarded email instead gives the family a one-click "send it to my school" button.

Wire it in three places:

- a step in the registration funnel (§5.5)
- prefill `TransferToSchoolModal` (`frontend/src/components/transcript/TransferToSchoolModal.jsx`) instead of typing the school by hand

- the bulk roster send (§5.6)

5.3 partner_offerings and partner_enrollments

The generalization of `poe_cohorts` / `poe_participants`.

```

partner_offerings
  id                uuid pk
  organization_id    uuid not null references organizations(id)
  slug              text not null unique          -- public URL key
  title             text not null                 -- "Competitive Season 2026-27"
  subject           text not null                 -- SCHOOL_SUBJECTS key: 'pe', 'fine_arts', ...
  credit_value       numeric not null default 0.5
  expected_hours     int                         -- the basis for the credit (§7)
  award_model        text not null default 'attestation' -- 'attestation' | 'portfolio'
  start_date         date
  end_date           date
  enrollment_opens_at timestampz
  enrollment_closes_at timestampz
  is_active          boolean not null default true
  syllabus           jsonb  -- outcomes, evidence guidance, task template,
                           -- branding (logo_url, hero_url) – everything that is
                           -- a constant at the top of routes/admin/poe.py today

partner_enrollments
  id                uuid pk
  user_id           uuid not null references users(id)
  offering_id        uuid not null references partner_offerings(id)
  class_quest_id     uuid references quests(id)
  status             text not null -- 'interested' | 'enrolled' | 'documenting'
                           -- | 'attested' | 'credit_awarded' | 'declined'
  partner_attested_at timestampz
  partner_attested_by uuid references users(id)
  partner_notes      text
  hours_reported     int
  credit_awarded_at  timestampz
  awarded_by         uuid references users(id)
  unique (user_id, offering_id)

```

Provisioning is `_provision_poe` with its constants read from `partner_offerings.syllabus` instead of module-level globals: create the per-student class quest, enroll, generate tasks from the template, write the enrollment row. Same function, same idempotency, no POE in it.

5.4 One award mechanism

Use the class-quest path (`class_review_status = 'credit_awarded' → class_credits` in the transcript). Retire the subject-XP deposit in `/api/admin/poe/award-credit` and the `poe_quest_ids` carve-out with it.

One blocker: the class path hardcodes `CLASS_CREDIT_VALUE = 0.5` in two files (`transcript_generator.py:64` , `public.py:336`). A full year of piano is 1.0. Add `quests.credit_value` numeric default `0.5` , set it from the offering, and read it in both places. Also revisit the hardcoded `grade: 'A'` — a participation-based credit is more defensibly recorded as `P` .

5.5 Enrollment: reuse the funnel

`/enroll/` (`registration_funnel.py`) is already org-neutral and already runs for Optio Academy, iCreate, and Gryffin. It handles the parts POE had to do by hand: account creation, Google and Apple sign-in, email OTP, attaching an account that already exists elsewhere, per-student questions, and e-signed paperwork into `parental_consent_log` .

Two additions:

- a **records destination** step writing `student_records_destination` (§5.2), configurable on per org so only credit partners see it
- an **offering** step when the org has more than one active offering

That replaces the entire `/poe` page, the `poe_signups` table, the confirmation email, and the manual link-participant step with configuration.

5.6 The partner's own surface

The piece POE never had, and the reason it needs a superadmin per student.

A roster page for the partner org admin, at `/partner` in the app, gated on the `credit_partner` module:

- **Roster** — who enrolled, who is documenting, who is attested, who is awarded
- **Attest** — check off participants at the end of the term, add hours and a note, submit. Writes `partner_attested_at` . Does **not** award.
- **Share** — their enrollment link and a QR code
- **Status** — counts only; no transcripts, no other families' data

On the Optio side, a "partner attested" queue in the existing Credit Review dashboard, plus a bulk approve for a whole roster, plus a bulk transcript send for the students whose families consented.

5.7 Phasing

Phase	Contents	Unblocks	Status
0	Partner-facing guide and partner agreement. No code.	Signing partners now, run manually on the POE path	Guide done ; agreement not written
1	<code>academy_enrollments</code> + accreditation fix (§3a), <code>student_records_destination</code> + funnel step, <code>TransferToSchoolModal</code> prefill	The registrar capture this project is about; manual operation at 10x	Built 2026-08-31, see §5.8
2	<code>partner_offerings</code> / <code>partner_enrollments</code> , generic provisioning, partner roster + attestation	Partners self-serve; superadmin out of the per-student loop	Not started
3	<code>quests.credit_value</code> , single award path, POE retired onto it, bulk send, partner dashboard	Multiple credit values; no per-program carve-outs	Not started

Phase 1 is the answer to "how do we gather the registrar info". Phase 2 is what makes it a program rather than a favor.

5.8 What phase 1 actually shipped

Migration `20260831000000_academy_enrollment_and_records_destination.sql` (applied to prod 2026-08-31; additive, two new tables, no data touched).

Piece	Where
Enrollment + destination logic, all idempotent	<code>backend/services/academy_enrollment_service.py</code>
Accreditation reads the enrollment first (§3a fix)	<code>backend/utils/accreditation.py</code> , wired at all 3 call sites
POST <code>/api/registration/registrations/<id>/records</code>	<code>backend/routes/registration_funnel.py</code>
Completion enrolls each student in Optio Academy	<code>academy_enrollment_service.enroll_registration_kids</code> , called from <code>_finish_fee_step</code>
Saved answers returned on resume	<code>academy_enrollment_service.destinations_for_kids</code>
The School records funnel step	<code>frontend/src/pages/RegisterFunnelPage.jsx</code>
Admin switches for both behaviors	<code>frontend/src/components/sis/RegistrationSetupTab.jsx</code>
Send form pre-fills from the stored destination	<code>frontend/src/components/transcript/TransferToSchoolModal.jsx</code>
Tests	<code>backend/tests/test_academy_enrollment.py</code> (22), <code>frontend/src/pages/registrationRecordsStep.test.jsx</code> (7), 6 added to <code>registrationSetupTab.test.jsx</code>

Turning a partner on (superadmin, no code):

1. Create the organization, or use the existing one.

2. SIS -> Registration: the family registration link is auto-provisioned.
3. On the Contacts & questions step, open **Optio Academy credit** and tick both switches (ask for the records destination; enroll in Optio Academy).
4. Save. The funnel gains a **School records** step, and finishing it enrolls each student in Optio Academy under `pathway='partner_credit'` with `partner_org_id` set to that organization.
5. Send the partner their link plus the guide.

Two deliberate limits, both waiting on phase 2:

- **The class quest is still provisioned by hand.** Enrollment records who is an Academy student and where the transcript goes; it does not yet create the per-student credit class. That is `partner_offerings` (§5.3).
- **auto_send_consent is captured but nothing sends on it yet.** The bulk send is §5.6. Until then the field records permission the family has given, and the Transfer to School form pre-fills from the same row.

6. What not to rebuild

Already in production and load-bearing:

- Account creation, Google/Apple, OTP, existing-account attach, e-signed paperwork, parental consent — the registration funnel
- Credit-class machinery: `quest_type='class'`, `transcript_subject`, submit-for-review, `credit_awarded`
- Transcript render, PDF, public verification page, registrar email, transfer audit log — 13 real sends
- WASC display and compliance constants (`frontend/src/constants/accreditation.js`)
- Org branding, org admin roles, invitations
- The mobile app journal and evidence capture

7. Decisions needed before Phase 2

These are business calls, not engineering ones. Each one changes what gets built.

1. **Who pays, and how much.** Leaning (2026-08-31): the **partner collects from families at their own price, and Optio invoices the partner at Optio's rate**. Pricing is negotiated per partner rather than published, so the partner guide deliberately carries no cost figure. Two consequences for the build: Optio needs partner-level invoicing (a per-term, per-head bill to the org, not a family checkout), and the funnel's Stripe fee step stays **off** for credit partners. Settle the rate card before Phase 2.
2. **The hours standard.** A WASC-accredited school awarding 0.5 credit for a soccer season needs a stated, documented basis. The common convention is 60 to 75 contact hours per 0.5 credit. Write the number down, put it in the partner agreement, and store it in `partner_offerings.expected_hours`. This is the single most important thing to settle: it is the first question a receiving registrar or an accreditation visit will ask.
3. **Is documentation required?** POE decided attendance alone earns the credit and documenting is optional. That is defensible for a supervised camp with a roster. It is weaker for "my coach says my kid

played." `award_model` supports both; pick the default.

4. **Grade convention.** A for everyone, or P for participation-based credit.
 5. **Teacher of record.** The Optio reviewer is the teacher of record and should be named on the transcript. Confirm who that is at volume.
 6. **What happens when a school says no.** A receiving district can decline any outside credit. The partner guide sets the expectation honestly (§ in the guide); confirm the refund or remedy position, if any.
-

8. Operational deliverables

- **Partner guide** — how it works, what the partner does, what Optio does, and ready-to-use website and parent messaging. Written: `docs/partner/CREDIT_PARTNER_GUIDE.html`. Cost was cut from it on 2026-08-31 (handled per partner); the remaining fill-ins are credit value, subject, dates, and contact.
- **Partner agreement** — the hours basis, attestation duty, data and consent terms, use of the Optio name and WASC phrase, term and termination. Not written yet.
- **Partner onboarding checklist** — create the org, enable the module, set the offering, generate the link, brief the partner on attestation.
